SALESFORCE HIRING TEAM

Hey Salesforce Team!

I'm Mike and I'm a Senior Software Engineer with hands-on experience in both front and back end technologies and I would like to pursue a career at Salesforce. I have applied online because I'm looking for a new challenging role where I can further grow my skills while being able to learn more about cutting-edge cloud architecture and contribute to the success of Salesforce.

In my current job at GE Healthcare, I have the opportunity to work on large scale applications and their respective codebases while also being a mentor to junior developers still learning the basics. My work has included front end technologies like React, Redux, JavaScript and Node with a heavy emphasis on test driven development. Backend technologies which I also have extensive experience in include: Java (Spring), Python, C++ and Ruby. Lucky for us, much of this technology stack overlaps with existing skillsets that Salesforce seems to be asking for in their engineers.

Since there are so many services that Salesforce offers, I took the liberty of perusing your product sweet for interesting teams to work on. I was delighted to find that I have relevant experience in many of the areas that Salesforce is active in. Perhaps I'd be a good fit in one of your Advanced Analytics platforms since data analytics has been a critical part to my job within my current company? Or maybe since I'm only two classes away from graduating with a master's degree in Artificial Intelligence from Georgia Tech I'd be a better fit on your Einstein AI team?

The point that I'm trying to make is that the more I research Salesforce positions the more I see that my skillset - coupled with my academic background - make me a perfect fit for Salesforce; we're compatible down to the last little detail. So, let's talk soon.

Sincerely,

Michael Mroczka
